EDUCATION

Bachelor of Software Engineering

Bahria University, Islamabad

Expected 2027

TECHNICAL SKILLS

Programming: C++, Python, JavaScript

Frameworks: React.js, Node/Express.js, FastAPI, TypeScript

Databases: SQL, MongoDB

Tools: Visual Studio, Docker, Git, Postman, Vercel

EXPERIENCE

Self-Directed ML & Full Stack Development

2023 – Present

Independent Projects - Bahria University, Islamabad

- Built ML pipelines covering regression, NLP, and LLM-based text generation using Python, Scikit-learn, and the Groq API.
 - Developed multiple full-stack web applications using React, Node.js, and SQL/NoSQL databases, with a focus on REST API design and responsive UI.
 - Actively building a portfolio targeting ML and web dev opportunities, with hands-on exposure to model evaluation, prompt engineering, and agentic AI tools.
-

PROJECTS

Machine Learning Projects

- **Intern Performance Prediction System** (Python, Scikit-learn, Random Forest, XGBoost)
Built regression models on 110+ records using attendance, task completion time, and feedback data; used Random Forest as baseline and improved prediction accuracy with XGBoost.
- **Interview Question Generator** (Python, LLaMA 3, Groq API, Prompt Engineering)
Built a text generation and fine-tuning pipeline using LLaMA 3 to auto-generate role-specific interview questions from intern profiles and job descriptions across 9 engineering domains.
- **Intern Feedback Sentiment Analysis** (Python, Logistic Regression, Transformers, NLP)
Performed NLP-based sentiment classification on 520+ feedback entries; compared traditional ML and transformer models for insights.

Full Stack Projects

- **Wonderland Toy Store E-Commerce** (React, Node.js, Express, MySQL, Three.js)
Developed full-stack application with admin panel and inventory system; implemented REST APIs and 3D model integration.
- **Dynamic Blog Platform CMS** (Node.js, Express, MongoDB)
Built content management system with CRUD operations and responsive UI.
- **Event Management System** (C#, SQL Server, REST APIs)
Developed QR-based check-in system with real-time database validation.

Frontend Projects

- **KeebX Interactive Product Page** (Next.js, TypeScript, Framer Motion, Canvas API)
Implemented scroll-based animations with 120+ frame rendering and interactive UI effects.

Core Coding Projects

- **Train Route Management System** (C++, SQL Server)
Designed system using doubly linked lists for efficient route traversal and storage.
 - **ATM Simulation System** (Java, OOP)
Simulated banking operations using object-oriented design principles.
 - **Turn-Based Strategy Game** (C++)
Developed multi-stage game applying inheritance and polymorphism.
-

ONGOING PROJECT

SnapCook Web Application (AI, Full Stack)

Developing AI-based system to generate recipes from ingredients using cloud and local models.
